Projects

Detection of Cyber Attacks Using Machine Learning

- **Objective:** Built a model to identify and classify network-based cyberattacks using machine learning.
- **Approach:** Cleaned and preprocessed real-world intrusion datasets; applied feature selection to optimize performance.
- **Execution:** Implemented Decision Tree, SVM, and Deep Belief Network algorithms; trained and tested models for accuracy and precision.
- **Insights:** DBN outperformed others in detecting complex and zero-day threats; emphasized the need for real-time adaptability.
- **Outcome:** Achieved high detection accuracy; proved ML models can effectively replace traditional security methods.

Grocery Store Management – SQL Project

Business Objective: Built a mini grocery store database to analyze sales, customers, products, and operations.

Approach: Designed 7 related tables; applied joins, aggregations, subqueries, and date filters to extract insights.

Key Insights: Identified top customers and best-selling products Analyzed supplier impact and employee performance Tracked monthly sales and order patterns

Conclusion: Improved understanding of relational databases and business analytics through hands-on SQL practice. Tackled challenges with foreign key constraints, multi-table joins, and cleaning date fields.
